Creating a new package

- osc meta -e pkg helloSC

```
<package name="helloSUSE" project="home:mstrigl">  
  <title></title>  
  <description></description>  
</package>
```

- osc mkpac helloSUSE
- add spec file
- add sources

```
-rw-r--r-- 1 marco users 10240 Feb 18 11:35 helloSUSE-1.0.tar.gz  
-rw-r--r-- 1 marco users 141 Feb 18 11:39 helloSUSE.changes  
-rw-r--r-- 1 marco users 1349 Feb 18 11:37 helloSUSE.spec
```

Creating a new package

```
Name:          helloSUSE
Version:       1.0
Release:       0
License:       GPL-1.0-or-later
Summary:       A simple greeter for the SUSECon 2019
Url:           https://github.com/lethliel/helloSUSE
Group:         Amusements/Toys/Other
Source:        %{name}-%{version}.tar.gz
BuildRoot:     %{_tmppath}/%{name}-%{version}-build

%description
This is just a small tool to greet all the nice
people who are attending the SUSECon 2019

%prep
%setup -q

%build
make helloSUSE

%install
mkdir -p $RPM_BUILD_ROOT/usr/bin
install ./helloSUSE %{buildroot}/usr/bin/helloSUSE

%files
/usr/bin/helloSUSE

%changelog
```

Basics of a spec file

Name	The name of the package. This will be used as a label later on.
Version	Version of the software
Release	Version of the package (think of how many times has the software been packaged)
License	Software license (https://spdx.org/licenses/)
Summary	Short description (displayed by rpm)
Url	Points to the documentation
Group	Group of the package
Source	Points to the source
BuildRoot	The build directory of the package

Basics of a spec file

%description	Detailed description of the software. More than one line
%prep	Is used to prepare the build environment, including: cleaning the old environment, setting up a new one, expanding the source archive.
%build	Here the build is performed. This can be very complex. But also very simple. In our case: make
%install	This section is used to “install” the application.
%files	List of files in the package
%changelog	Changes to the package

_service files (another way to get the source)

```
<services>
  <service name="obs_scm">
    <param name="url">git://github.com/lethliel/helloSUSE.git</param>
    <param name="scm">git</param>
    <param name="revision">master</param>
    <param name="versionformat">1.0~pre%cd.%h</param>
  </service>
  <service name="tar"/>
  <service name="recompress">
    <param name="file">*.tar</param>
    <param name="compression">gz</param>
  </service>
  <service name="set_version"/>
</services>
```

__service files

- osc service run (to run all services locally)

```
drwxr-xr-x 3 marco users 4096 Feb 18 11:51 helloSUSE
-rw-r--r-- 1 marco users 141 Feb 18 11:39 helloSUSE.changes
-rw-r--r-- 1 marco users 1349 Feb 18 11:37 helloSUSE.spec
-rw-r--r-- 1 marco users 440 Feb 18 11:56 _service
-rw-r--r-- 1 marco users 1033 Feb 18 11:56 _service:obs_scm:helloSUSE-1.0~pre20190218.df81158.obscpio
-rw-r--r-- 1 marco users 117 Feb 18 11:56 _service:obs_scm:helloSUSE.obsinfo
-rw-r--r-- 1 marco users 445 Feb 18 11:56 _service:recompress:tar:helloSUSE-1.0~pre20190218.df81158.tar.gz
-rw-r--r-- 1 marco users 1369 Feb 18 11:56 _service:set_version:helloSUSE.spec
```

- source got downloaded as .obscpio
- archived as tar
- compressed as gzip
- modified spec file _service:set_version:helloSC.spec

_service files (another way to get the source)

```
Name:          helloSUSE
Version:       1.0~pre20190218.df81158
Release:      0
License:      GPL-1.0-or-later
Summary:      A simple greater for the SUSECon 2019
Url:         https://github.com/lethliel/helloSUSE
Group:       Amusements/Toys/Other
Source:      %{name}-%{version}.tar.gz
BuildRoot:   %{_tmppath}/%{name}-%{version}-build
```

_service files (another way to get the source)

```
<services>
  <service name="obs_scm">
    <param name="url">git://github.com/lethliel/helloSUSE.git</param>
    <param name="scm">git</param>
    <param name="revision">master</param>
    <param name="versionformat">1.0~pre%cd.%h</param>
  </service>
  <service name="tar" mode="builddtime"/>
  <service name="recompress" mode="builddtime">
    <param name="file">*.tar</param>
    <param name="compression">gz</param>
  </service>
  <service name="set_version" mode="builddtime"/>
</services>
```

Basics of services

There are a lot of services out there. The most important ones:

obs-service-download_file	download a file
obs-service-tar_scm	create a tar ball from svn/git/hg
obs-service-set_version	update spec file version string
obs-service_recompress	recompress files
obs-service-format_spec_file	reformats a specfile to SUSE standard

Basics of services

Modes:

default	Run after each commit on the server and locally before every build
trylocal	Just locally. Results are not saved with <code>_service:</code> prefix and will be skipped if they are the same
localonly	Just run locally. Results are prefixed with <code>_service:</code>
serveronly	Just run on the server
buildtime	Runs during the build. This means the service package becomes a BuildRequires. Service with <code>mode="buildtime"</code> do not have network access
disabled	Disable the service

Local builds

- osc repos

```
openSUSE_Leap_42.3    x86_64
openSUSE_Leap_42.2    x86_64
openSUSE_Leap_42.1    x86_64
openSUSE_Leap_15.0    x86_64
openSUSE_Leap_15.0    armv7l
openSUSE_Factory_ARM  armv7l
openSUSE_Factory_ARM  aarch64
openSUSE_Factory       i586
openSUSE_Factory       x86_64
```

- osc build <repository> <arch> <recipe>
- osc build openSUSE_Factory x86_64 helloSUSE.spec
- the local build starts

Local builds

```
Run source service: /usr/lib/obs/service/obs_scm --url git://github.com/lethliel/helloSUSE.git --scm git --revision master --version
format 1.0-pre%cd.%h --outdir /home/marco/obs/home:mstrigl/helloSUSE/tmplUHZLz.obs_scm.service

Meta information

But I don't want to build my package for all those repositories!

```
openSUSE_Leap_42.3    x86_64
openSUSE_Leap_42.2    x86_64
openSUSE_Leap_42.1    x86_64
openSUSE_Factory_ARM  armv7l
openSUSE_Factory_ARM  aarch64
openSUSE_Factory       i586
openSUSE_Factory       x86_64
images                 x86_64
SLE_12_SP3             x86_64
Fedora_27              x86_64
Fedora_26              x86_64
Debian_8.0             i586
Debian_8.0             x86_64
Arch                   i586
Arch                   x86_64
```

Solution?

Disable the build on package level!

can be based on repository and arch or both

Let's disable all non openSUSE / non x86_64 builds!

Meta information

osc meta -e pkg helloSUSE

Advanced Topics

_constraints (more power)

_constraints files are used to use workers with special features or minimum system requirements.

Basic anatomy:

```
<constraints>
  <hardware>
    <disk>
      <size unit="G">500</size>
    </disk>
  </hardware>
</constraints>
```

constraints (more power)

- osc checkconstraints

Repository	Arch	Worker
-----	----	-----
openSUSE_Leap_42.3	x86_64	0
openSUSE_Leap_42.2	x86_64	0
openSUSE_Leap_42.1	x86_64	0
openSUSE_Leap_15.0	x86_64	0

- osc rbl home:mstrigl helloSUSE openSUSE_Factory x86_64

```
package build was not possible:  
no compliant workers (constraints mismatch hint: hardware:disk)  
Please adapt your constraints.
```

constraints (more power)

- change the disk size to 50 GB

Repository	Arch	Worker
-----	----	-----
openSUSE_Leap_42.3	x86_64	25
openSUSE_Leap_42.2	x86_64	25
openSUSE_Leap_42.1	x86_64	25

- osc checkconstraints openSUSE_Factory x86_64

```
Worker
-----
x86_64:cloud131:1
x86_64:cloud131:2
x86_64:cloud132:1
x86_64:cloud132:2
x86_64:cloud133:1
x86_64:cloud133:2
```

Basics of constraints

hostlabel		Label of the worker. Can be used for reproducible builds
sandbox		chroot/Xen/KVM/secure
linux		Kernel specific part
	version	Specific kernel version
	min	Minimal kernel version
	max	Maximal kernel version
flavor		Specific kernel flavor (default / smp)

Basics of constraints

hardware			Hardware features
	cpu		Cpu related
		flag	Features provided (like mmx). Can be used multiple times
		processors	Minimal amount of processors
	Disk	size	Minimal size of disk
	memory	size	Minimal size of memory (including swap)
	Physicalmemory	size	Minimal site of memory (swap excluded)

osc blame

```
1 (mstrigl 2019-02-18 11:30:46 31)
1 (mstrigl 2019-02-18 11:30:46 32) %prep
1 (mstrigl 2019-02-18 11:30:46 33) %setup -q
1 (mstrigl 2019-02-18 11:30:46 34)
1 (mstrigl 2019-02-18 11:30:46 35) %build
4 (mstrigl 2019-02-18 12:11:30 36) sleep 1000
1 (mstrigl 2019-02-18 11:30:46 37) make helloSUSE
```

That's why the build stalls. I accidentally added a sleep 1000?!

```

Investigating the environment

The local package cache is per default in “/var/tmp/osbuild-packagecache”
It can be necessary to delete it.

```
drwxr-xr-x  3 marco users  4096 Feb 14 12:57 openSUSE:Factory/

drwxr-xr-x  3 marco users  4096 Feb 14 11:57 openSUSE:Leap:15.0:NonFree/  
drwxr-xr-x  3 marco users  4096 Feb 14 11:57 openSUSE:Leap:15.0:Update/  
drwxr-xr-x  3 marco users  4096 Feb 12 14:47 openSUSE:Leap:42.1/
```

Proper changelog

- Describe what you have done and **WHY**
- Include version changes or point to a versioned changelog
- Mention bug references
- Do not delete bug references
- Mention added, deleted or changed patches

Thanks for your attention!

Q&A
